THE OPERATIONAL EXPERIENCE OF THE SCENAR-CENTRE

Our Scenar-centre, is, probably, the youngest and it is for the time being the only one in Bulgaria and on Balkan peninsula. We'd like to tell about a history of its creation.

At the end of 1999 our friend who lives and works in London, read an article in which it was told about the Scenar device. His mother was ill, and he was ready to use any opportunity. We agreed to try the treatment. One month later we got the small black device with the passport and the instruction in English.

At the beginning we treated our relatives, friends. We have received good results, but we had a lot of questions and there was nobody to ask, to consult. The work was conducted only according to intuition and experience. The first Scenar-complications which we couldn't explain appeared. The patients stopped the treatment. And in the instruction—there were no words about it, absolutely normal, and as it is already known, expected stage of Scenar-THERAPY.

After the carried out advertising many ill people with various diseases began to come to me. They hoped, that Scenar will help them. There were a lot of heavy and wearisome days, but also there was a lot of satisfaction and gratitude as well.

During the difficult summer months we treated more than 200 patients: the diseases of nervous system—72 patients; locomotor apparatus - 63; digestive system—29; respiratory system—15; urinogenital—18; dermatological falling ill - 15 patients.

The time of using Scenar is small—that's why there are not detailed statistics, there are general impressions.

The best results we achieved during the work with sportsmen, first of all, football players. Many of them were convinced of the wonderful effect of Scenar-THERAPY, and now they come to us at the beginning of their problems. There are quite good results at treatment of the patients with the diseases of a backbone and joints, other neurologic problems; there are also good results at treatment of the patients with the combined diseases of a stomach and intestines; these are, first of all, people of average and already mature age.

The first successes were received in treatment of renal-stone illness, tireotoxicosis, aceptic necrosis, Alzheimer's disease, postinsult conditions etc. After the summer conference and school, (due to our friends from Ekaterinburg and Tomsk) which have given us the necessary information, we began to treat especially seriously ill patients. For example, 20-years old patient, contusion of a spinal cord, quadriplegia after accident, two years was

in reanimation, breathing with the help of the device of artificial breath. There are the first positive results—some active weak movements and transition to the more prolonged periods of the independent breath, the improvement of the general condition and a muscular tone.

We don't have a lot of patients—children, though we know very well that, that “the children undergo the treatment well”. But their parents do not trust the new therapy.

During the initial school my teacher Joseph Semikatov advised: “Begin with the simple cases to obtain the experience and confidence and then pass to the complicated ones”.

It turned out to be impossible in Bulgaria. We are the pioneers, and only those, who tried everything possible come to us.

At the end of August, 2000 the regular Balkaniada on tennis for doctors was carried out. There we acquainted them with the new therapy and the wonderful device. Many colleagues with sport traumas were helped in the real time. Scenar-THERAPY caused a great interest among the doctors from Turkey, Greece, Romania and Macedonia.

Our conclusions:

Scenar—is a wonderful device. The tears of pleasure on the faces of our patients and in our own eyes prove this. It is necessary to work together, in one command. It is necessary to create a collective of the convinced, self-denying and knowing doctors, to work out the new approach to the patients, to study a lot.
